

MUHAMMAD HAMZA JAVAID

Full Stack Engineer & Technical Lead | Angular · Java | Fintech & Digital Banking

Lahore, Pakistan · +92 303 0842792 · JavedHamza361@gmail.com · linkedin.com/in/muhammad-hamza-javaid-5a08b421b

Open to remote · Based UTC+5 — full working-day overlap with GCC & Europe, partial overlap with US East

PROFESSIONAL SUMMARY

Full stack engineer and technical lead with 7+ years in fintech, digital banking, and insurance. Four years building end to end on Angular and Java/Hibernate for Credit Objects, an Australian fintech — loan origination, settlement, and insurance platforms, delivered across time zones with remote product owners — followed by three years leading frontend architecture on a live digital banking product, including a real-time contact-centre console on WebSockets and SIP. I currently lead 4–6 engineers, own architecture and engineering standards, and carry production support. My backend delivery is Java with Hibernate/JPA (2019–2023); my frontend work is current through Angular 20.

TECHNICAL SKILLS

Frontend	Angular v8 – v20 (7 years continuous), TypeScript, Signals , Standalone Components, RxJS, NgRx, new control flow (@if / @for), version migrations, SCSS, PrimeNG, Angular Material
Backend & Data	Java, Hibernate / JPA, Maven (production delivery 2019 – 2023), REST API design, MySQL, stored procedures, Node.js, JWT authentication
Real-time & Integration	WebSockets (connection lifecycle, reconnect/backoff, event-driven state sync), SIP telephony integration , HTTP interceptor layers, third-party API integration
Architecture	Layered frontend architecture, Nx modular monorepo, micro-frontend design, lazy loading, role-based access control, shared component libraries
Testing, Cloud & DevOps	Jasmine / Karma unit testing, ESLint, code review standards · AWS (EC2, S3, RDS, CloudFront), Docker, Git / GitHub, GitLab CI/CD, Datadog
Fintech Domain	Digital wallets, KYC / CDD and sanctions-screening workflows, card lifecycle operations, loan origination & settlement, insurance claims, regulatory & compliance reporting
Leadership	Technical lead for 4–6 engineers, architecture ownership, code review process, sprint planning, estimation, mentoring, production on-call, Agile / Scrum

PROFESSIONAL EXPERIENCE

Digitify Pakistan Limited — YAP Mobile Wallet · Lahore, Pakistan
Senior Software Engineer → Technical Lead (Frontend) | Dec 2023 – Present

YAP Pakistan Admin Portal | Angular 17 → 20 | Fintech / Digital Banking | Mar 2024 – Present
Admin platform for a digital banking super-app — customer accounts, cards, transactions, KYC and compliance review, onboarding, contact centre, and system configuration, running in live production.

- Architected and built the YAP Pakistan Admin Portal from an empty repository as technical lead, guiding 4–6 engineers across **32 feature modules** covering the full customer lifecycle — onboarding, account management, KYC and compliance review, card operations, transactions, customer support, and system configuration.
- Delivered first production release in **under four months** and established the architecture, development conventions, and code review process the team still works to.
- Platform is used daily by the bank’s operations, compliance, and support teams to administer **22,000+ customer records** across active, pending, and rejected states.
- Built the portal’s **customer support and contact-centre console** — the most technically demanding module — covering inbound and outbound calling, live call logs, ticketing, agent activity tracking, and supervisor management for dozens of concurrent agents.
- Integrated **SIP telephony** into the browser for call handling, and engineered the **WebSocket** layer underneath it: connection lifecycle with reconnect and backoff, heartbeat handling, and event-driven synchronisation of call state, agent presence, and live queue data across supervisor and agent views.
- Designed a layered frontend architecture — standalone components (UI layer) → HTTP service layer → HTTP interceptor (JWT attach, token refresh, global error handling) → injectable NgRx store, with **Signals** for reactive local state — giving consistent data flow across all 32 modules.
- Led the **Angular 19 → 20 migration**: audited breaking changes, restructured modules, and adopted the new control flow syntax (@if / @for), migrating all 32 modules with no P1 or P2 defects reported after cutover.
- Implemented role-based access control, route guards, and ESLint standards, with Jasmine/Karma unit tests across core services and shared components.
- Carry production support — incident triage and resolution through Datadog, with same-day hotfix turnaround on customer-impacting issues.
- Run sprint ceremonies on two-week cycles, manage team workload, and lead technical and domain discussions with business and compliance stakeholders.

MATW Humanitarian Platform | Angular | Non-profit / Humanitarian Aid | Dec 2023 – Feb 2024

Global donation and impact platform handling multi-currency transactions and contribution tracking across multiple regions.

- Built dynamic modules (Quick Donate, Ali Banat, Contact, FAQs) with Strapi CMS integration, letting non-technical staff manage content without engineering involvement.
- Implemented internationalisation across five languages and a regional currency calculation engine with country-based routing to meet regional financial regulations.
- Delivered the full platform inside a fixed three-month engagement, meeting every sprint commitment.

A J Software Private Limited · Lahore, Pakistan — Pakistan engineering arm of Credit Objects, Australia

Software Engineer | Jul 2020 – Nov 2023

Associate Software Engineer | Jun 2019 – Jun 2020

ORION & Lender — Finance & Insurance Platform | Angular 12 + Java / Hibernate | Australian Fintech | Jul 2020 – Nov 2023

Two interconnected enterprise fintech platforms for the Australian market — ORION (broker & insurance) and Lender (loan assessment & compliance) — covering the loan lifecycle from application to settlement.

- Delivered features end to end across a **3.5-year engagement** — Angular frontend through to the **Java / Hibernate** backend — on platforms used by Australian financial institutions to automate loan and compliance workflows.
- Built and maintained **REST APIs in Java with Hibernate ORM** (Maven build), modelling complex loan lifecycle data, payment calculations, and compliance reporting across the full application-to-settlement flow.
- Wrote stored procedures for heavy loan-data queries and regulatory reporting workflows where ORM-level access could not meet performance requirements.
- Owned multiple modules end to end, frontend and backend: Point of Sale, Loan Assessment, Settlement Management, Contract Modification, and System Administration.
- Centralised frontend state in **NgRx**, removing a class of cross-component synchronisation bugs that had been a recurring source of UI defects.
- Built three micro-applications within a unified Angular workspace — Lender Portal, Broker Portal, and Insurance Management.
- Delivered PDF generation via XSLTs, Grape City spreadsheet integration for Income/Asset/Expense/Liability reporting, and dashboards using Wijmo Flex and Google Charts.
- Executed Angular version migrations across both platforms, sequencing releases so users mid-session were never served a broken bundle.

LIFE — Event Management Platform | React + Node.js | Jul 2021 – Dec 2021 (concurrent project)

- Built the React frontend — reusable component library, event listing and detail views, client dashboards, and RSVP workflows.
- Engineered the **Node.js** backend: REST APIs, event scheduling logic, client notifications, and MySQL persistence.

VIRM & CMS — Vehicle Insurance & Claim Management | Angular 8 | Australian government insurance body | Jun 2019 – Jun 2020

- Developed Angular frontend across VIRM — vehicle registration flows, policy management views, renewal processing, and admin dashboards — and the claim lifecycle view layer for CMS, covering claim submission, assessor assignment, status tracking, and resolution.
- Built reusable UI components, form validation, and REST API integration; worked with Angular Material, Bootstrap, MySQL, WildFly, and AWS (EC2 / S3 / RDS) with JWT-based authentication across both platforms.

EDUCATION

Bachelor of Science — Computer Science | 2015 – 2019

COMSATS University Islamabad (CUI) — Lahore Campus
